Professional Summary

Full-stack developer experienced in Go, React, and PostgreSQL, with JWT authentication, WebSocket-based real-time systems, and CI/CD pipelines deployed on Vercel. Solo-shipped a production finance API with full test coverage, and led backend development (~30% of all commits) on a 6-person team building a real-time social platform.

Technical Skills

Languages: Go, Python, JavaScript, SQL, HTML/CSS

Frameworks: Gin, GORM, React, Django, Tailwind CSS

Tools: Git, GitHub, GitHub Actions, Docker, Vercel

Databases: PostgreSQL, SQLite

Practices: REST API Design, JWT Auth, WebSockets, CI/CD, Peer Collaboration

Projects

[Piggy Bank](#) — Personal Finance Tracker (Go, React, PostgreSQL) · Solo project

- Built a solo RESTful API in Go (Gin, GORM, PostgreSQL) with JWT authentication and access/refresh token rotation, delivering full CRUD across 5 core resources plus an aggregated insights endpoint
- Wrote a backend test suite with Go's race detector, catching a real transactional-isolation bug before it reached production
- Set up CI/CD with GitHub Actions and deployed frontend and backend independently on Vercel; solo-authored roughly 95% of all commits (remainder automated CI checks)

Experience

Software Engineering Apprentice — Zone01 Kisumu · Jan 2026 – Present

Full-time, project-based software engineering apprenticeship focused on backend, frontend, AI-assisted development, system design, and team collaboration through real-world projects.

Backend Lead & Full-Stack Contributor — Social Network (Team Project) — Jun 2026

- Top contributor by commit volume (~30% of all commits) on a peer team of 6, building the foundational backend: authentication, middleware, CORS, and the user, session, and follower data models
- Built a real-time chat and notification system end to end using WebSockets, across both the Go backend and the React frontend

Core Strengths

- **End-to-end ownership:** took Piggy Bank solo from schema design through production deployment
- **Debugging under pressure:** diagnosed a transactional-isolation bug using Go's race detector before it reached production
- **Infrastructure troubleshooting:** fixed a Docker networking bug (backend not bound to 0.0.0.0)
