PROFESSIONAL SUMMARY

Full-stack developer skilled in building CLI tools and RESTful APIs with Go, and responsive frontend interfaces with React, JavaScript, and Tailwind CSS. Strong foundation in relational databases, system design, and Git-based version control. Trained through Zone 01 Kisumu's project-based software engineering apprenticeship, collaborating on real-world, team-built applications from architecture through deployment.

TECHNICAL SKILLS

Languages: Go, Python, JavaScript, SQL, HTML/CSS.

Frameworks: Gin, GORM, React, Django, Tailwind CSS, FastAPI.

Tools: Git, GitHub, Docker, Vercel.

Databases: PostgreSQL, SQLite.

Practices: REST API Design, JWT Auth, WebSockets, CI/CD, Peer Collaboration.

WORK EXPERIENCE

Zone01 Kisumu

Software Engineering Apprentice

Kisumu, Kenya

January 2026 – Present

- Full-time, project-based software engineering apprenticeship building full-stack applications across teams of 2–6 developers, using Go, Gin, Python, FastAPI, JavaScript, React, and PostgreSQL to deliver backend services, frontend interfaces, and database systems while incorporating AI-assisted development to accelerate iteration and debugging.
- Collaborated with teams of 4–5 developers across 5 hackathons, moving from problem statement to working prototype within tight deadlines, winning 1st place at a Bitcoin Lightning Network hackathon.
- Led backend development for Chama, a group financial management platform, architecting a domain-driven package by feature backend structure in Go/Gin with PostgreSQL, building unified utilities for centralized error handling and standardized response types (success, error, pagination), and owning the contributions feature as the team of 7 progressed toward deployment.
- Worked within a shared codebase through Git-based collaboration, opening numerous pull requests, resolving 10+ bugs, and maintaining backend documentation across peer reviews and technical discussions with the wider team.

PROJECTS

Piggy Bank — Personal Finance Tracker ([Git](#))

A personal finance application that helps with expense and goals tracking as well as budgeting.

- Built a RESTful API in Go (Gin, GORM, PostgreSQL) with JWT authentication and access/refresh token rotation, delivering full CRUD across 5 core resources plus an aggregated insights endpoint.
- Wrote backend tests with Go's race detector, catching a real transactional bug before it reached production.
- Set up CI/CD with GitHub Actions and deployed frontend and backend independently on Vercel; This ensured that code was pushed passing tests thereby confirming that the pre existing code wasn't broken.

Bloom — Task & Habit Tracker ([Git](#))

A productivity app for task management, habit tracking, and personal growth

- Built a full-stack application using Node.js/Express and Prisma ORM on PostgreSQL, with a React (Vite) and Tailwind CSS frontend, implementing JWT authentication.
- Architected the backend with a controller-service-route pattern across 5 resource domains (auth, tasks, habits, events, users), with centralized error-handling middleware for consistent API responses.
- Integrated the Google Calendar API for two-way task and event syncing, and built 2 automated background jobs with node-cron for daily calendar sync, and hourly recurring-task processing.
